CONVERSION FACTORS AND ABBREVIATIONS

<i>Multiply</i>	<i>By</i>	<i>To obtain</i>
inch (in.)	25.4	millimeter
foot (ft)	0.3048	meter
mile (mi)	1.609	kilometer
square mile (mi ²)	2.590	square kilometer

Temperature in degrees Fahrenheit (°F) as follows:

$$^{\circ}\text{F} = 9/5(^{\circ}\text{C}) + 32$$

Lake level: In this report, "lake level" refers to the elevation of a lake surface as determined by readings on a graduated lake-stage gage installed in the lake. The elevation is relative to an arbitrary local datum at each lake site.

Abbreviated water-quality units used in this report: Chemical concentrations and water temperature are given in metric units. Chemical concentration is given in milligrams per liter (mg/L) or micrograms per liter (µg/L). Milligrams per liter is a unit expressing the concentration of chemical constituents in solution as weight (milligrams) of solute per unit volume (liter) of water. One thousand micrograms per liter is equivalent to one milligram per liter. For concentrations less than 7,000 mg/L, the numerical value is the same as for concentrations in parts per million.

SYMBOLS AND ABBREVIATIONS USED IN TABLES

MG/L	milligrams per liter (mg/L)
UG/L	micrograms per liter ($\mu\text{g}/\text{L}$)
MG/KG	milligrams per kilograms (mg/kg)
US/CM	microsiemens per centimeter ($\mu\text{s}/\text{cm}$)
DEG C	degrees Celsius ($^{\circ}\text{C}$)
BOT.	bottom
MAT.	material
WATSTORE	U.S. Geological Survey's Water Data Storage and Retrieval System
PH	pH
CACO ₃	calcium carbonate (CaCO ₃)
CA	calcium (Ca)
MG	magnesium (Mg)
NA	sodium (Na)
K	potassium (K)
CL	chloride (Cl)
SO ₄	sulfate (SO ₄)
F	fluoride (F)
SIO ₂	silica (SiO ₂)
N	nitrogen (N)
NO ₂	nitrite (NO ₂)
NO ₃	nitrate (NO ₃)
P	phosphorus (P)
AS	arsenic (As)
AL	aluminum (Al)
BA	barium (Ba)
BE	beryllium (Be)
CD	cadmium (Cd)
CR	chromium (Cr)
CO	cobalt (Co)
CU	copper (Cu)
FE	iron (Fe)
PB	lead (Pb)
MN	manganese (Mn)
HG	mercury (Hg)
MO	molybdenum (Mo)
NI	nickel (Ni)
SE	selenium (Se)
SR	strontium (Sr)
AG	silver (Ag)
ZN	zinc (Zn)

DATA ON WATER QUALITY, LAKE SEDIMENT, AND LAKE-LEVEL FLUCTUATION, ST. CROIX INDIAN RESERVATION, WISCONSIN, 1981-87

By

David P. Krabbenhoft and James T. Krohelski

ABSTRACT

This report is a compilation of data on surface- and ground-water quality, lake sediment, and lake-level fluctuation collected by the U.S. Geological Survey (USGS) during 1981-87 on or near the St. Croix Indian Reservation. The purpose of this report is to provide baseline data on selected aspects of the water resources of the St. Croix Indian Reservation as a reference by which future hydrologic changes can be discerned. The tribal lands are adjacent to Bashaw, Big Round, Big Sand, Clam, Gaslyn, Rice, and Sand Lakes and the Danbury Settlement along the St. Croix River. Water samples from each of these lakes and Bear Lake, which is not adjacent to tribal land, were analyzed for water-quality indicators. Lake-level fluctuations also were measured for each lake except Big Round Lake. Grain-size and chemical analyses were done on lake-sediment samples from Bashaw, Rice, Clam, Gaslyn, and Bear Lakes. Ground-water samples from wells on or near tribal land in Burnett County (27 wells) and Polk County (3 wells) were collected and analyzed for water quality.

INTRODUCTION

This report is a compilation of data on surface- and ground-water quality, lake sediment, and lake-level fluctuation collected by the U.S. Geological Survey (USGS) during 1981-87 on or near the St. Croix Indian Reservation. The purpose of this report is to provide baseline data on selected aspects of the water resources of the St. Croix Indian Reservation as a reference by which future hydrologic changes can be discerned. Water-resources data were collected only on and near tribal lands established by the Indian Reorganization Act of 1934 (Lurie, 1987). Reservation tribal lands are located in Burnett, Polk, and Barron Counties in northwestern Wisconsin. The tribal lands are adjacent to Bashaw, Big Round, Big Sand, Clam, Gaslyn, Rice, and Sand Lakes and the Danbury Settlement along the St. Croix River (fig. 1). Water samples from each of these lakes and Bear Lake, which is not adjacent to tribal land, were analyzed for water-quality indicators. Lake-level fluctuations also were measured for each lake except Big Round Lake. Grain-size and chemical analyses were made of lake-sediment samples from Bashaw, Rice, Clam, Gaslyn, and Bear Lakes. Ground-water samples from wells on or near tribal land in Burnett County (27 wells) and Polk County (3 wells) were collected and analyzed for water quality.

The authors acknowledge the assistance of members of the St. Croix Indian Tribe who served as local observers and recorded lake-level data.

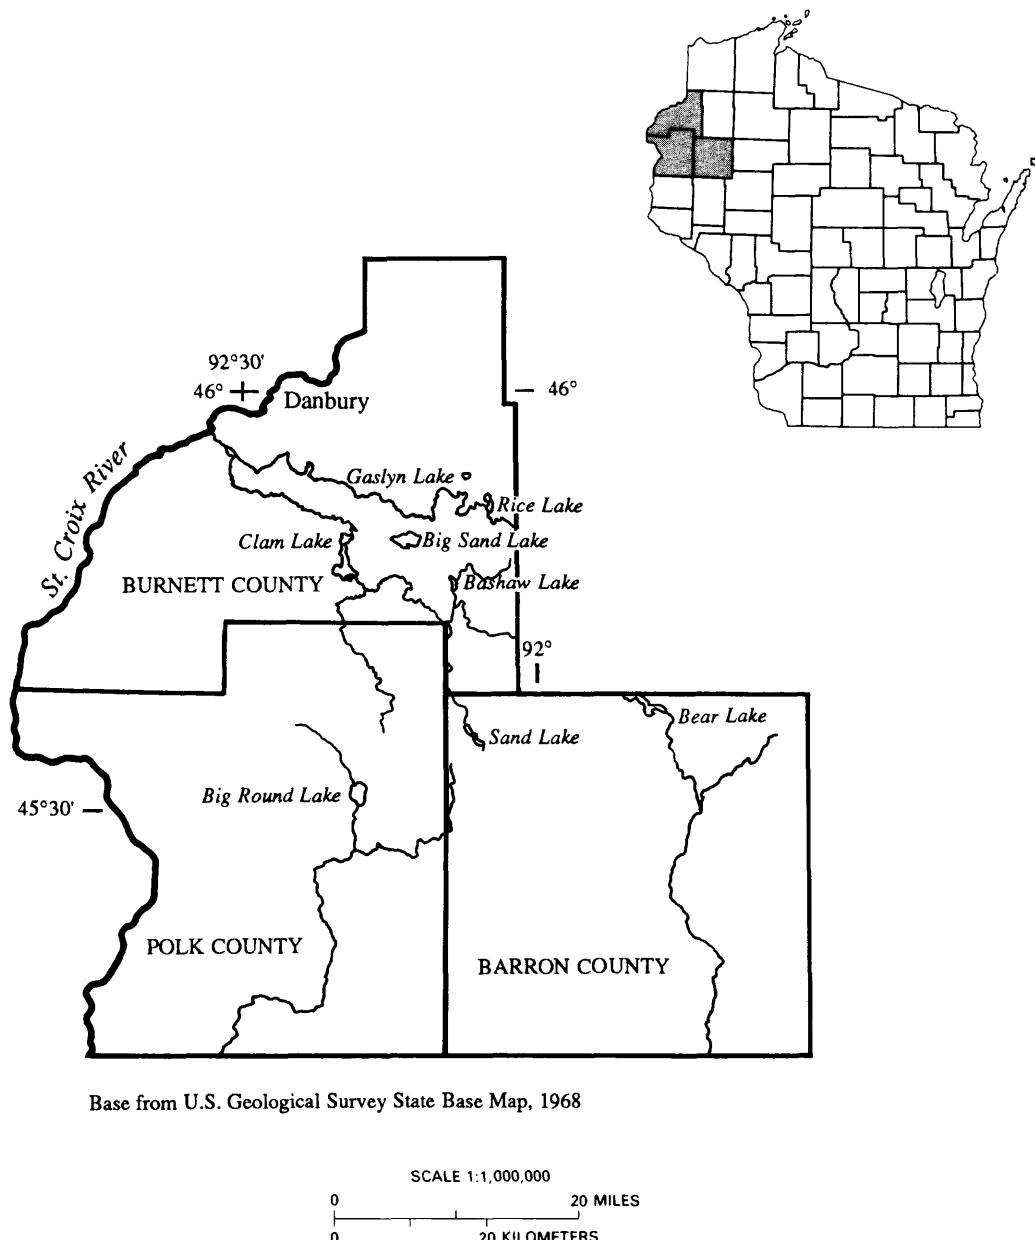

Figure 1. Location of the St. Croix Indian Reservation and lakes monitored.

DATA COLLECTION AND ANALYSIS

Vertical-depth profiles of dissolved-oxygen concentration, water temperature, pH, and specific conductance, in addition to analyses of water-quality samples, were made for each of the eight lakes studied. Data for the depth profiles were collected from the middle of each lake by lowering sensors to the various depths from a stationary boat. The water-quality samples were analyzed by the USGS National Water Quality Laboratory for physical and chemical characteristics listed in the water-quality tables that follow. Water-quality data are stored in the USGS Water Data Storage and Retrieval System (WATSTORE).

Ground-water samples were collected from 30 wells, the locations of which are shown on the site maps for each of the study areas. The samples were analyzed in the field for temperature, pH, and specific conductance. Ground-water samples were also analyzed by the USGS National Water Quality Laboratory for the physical and chemical characteristics listed in the water-quality tables.

Lake-sediment samples were collected from the bottom material of Bashaw, Rice, Clam, Gaslyn, and Bear Lakes. Each sample was split; one part was sent to a sediment laboratory at the USGS office in Iowa City, Iowa, for grain-size analysis, and the other was sent to the USGS National Water Quality Laboratory for chemical analyses. These chemical analyses included determination of concentrations of total ammonia, total ammonia plus organic nitrogen, total nitrate plus nitrite, and total phosphorus.

Lake levels were monitored by members of the Tribe, who read lake-stage gages at each of the study lakes during ice-free periods. Gage-height elevations are relative to a local benchmark datum; therefore, the lake levels for the individual lakes should not be compared to one another.

PRESENTATION OF DATA

Because each of the study areas is geographically separated, the data are grouped and presented separately by area rather than by type of data. Maps showing the tribal-land boundaries, study lake, location of wells sampled, location of lake-stage gage, and the location where the lake-sediment sample (if any) was collected are presented for each study area.

Water-quality tables presented for each study area consist of a lake-water-quality table (multiple samplings for some sites) and a ground-water-quality table (if any nearby wells were sampled). Results of the ground-water-quality analyses can be compared to table 1, in which Wisconsin drinking-water standards are listed (Wisconsin Department of Natural Resources, 1978).

For Bashaw, Rice, Clam, Gaslyn, and Bear Lakes, the results of chemical analyses on bottom sediment are presented in the lake-water-quality tables and are identified by "SEDIMENT" in the "medium" columns (to differentiate

them from water samples, which are identified as "WATER"). Grain-size-distribution graphs for the sediment samples also are included for each of these five lakes.

Graphs showing vertical-depth profiles of dissolved-oxygen concentration, water temperature, pH, and specific conductance are included for each lake. Two profile graphs are presented for Gaslyn Lake because measurements were made during consecutive years.

A hydrograph showing lake-level fluctuations over the period of record is presented for each lake except Big Round Lake, for which no such data were available.

Well sites are identified in the ground-water-quality tables by a unique 15-digit station number. The first six digits of the station number are latitude of the site (degrees, minutes, seconds), the next seven are longitude (degrees, minutes, seconds), and the last two are sequence numbers that identify individual wells at sites with multiple wells. Each well is also identified by a local identifier consisting of a two-letter county abbreviation; the township, range, and section; and a four-digit number assigned to each well. Only the two-letter county-code abbreviation and the last four-digit number in the local identifier are used to show wells on the site map for each study area.
